

Here is our recommendation for code to use in your css stylesheet when using the House Industries web fonts. Just copy and paste this code into your style sheet, replacing “HouseSlant” with the name of the font. Then apply to desired rule, as shown below applied to an h3 tag. We recommend using “`text-rendering: optimizeLegibility;`” in order to ensure that kerning is applied correctly in all browsers.

<pre>@font-face { font-family: "House Slant"; src: url('HouseSlant.eot'); src: url("HouseSlant.eot?#iefix") format("embedded-opentype"), url("HouseSlant.woff") format("woff"); font-style: normal; font-weight: 400; font-stretch: normal; }</pre>	<p>Replace “House Slant” with a name of your choosing. The next 2 lines should contain the “eot” filename. Note that if the fonts are in a subdirectory, that location must also be specified.</p> <p>This line should contain the “woff” filename, and location, if in a subdirectory.</p> <p>If you are using each font separately, use the style and weights shown. If the fonts should behave as part of a family, see notes below.</p>
<pre>h3 { font-family: "House Slant", script; text-rendering: optimizeLegibility; font-weight: normal; }</pre>	<p>We suggest the use of “optimizeLegibility” to ensure that kerning is applied in all browsers. Setting the font weight to normal in a Header tag will make sure you don't get “faux bolding” added.</p>

Setting up font families:

If you are setting up a font family, and wish the <i> tag to show the italic version of the font, you need to set the weights and styles correctly. In this case, you need an @font-face section for each font, but set the font-style and font-weight like this:

```
(for roman font)...
    font-weight: normal;
}
(for italic font)...
    font-weight: normal;
    font-style: italic, oblique;
}

(for bold font)...
    font-weight: bold;
    font-style: normal;
}
```

```
(for bold italic font)...  
    font-weight: bold;  
    font-style: italic, oblique;  
}
```
